

Counterpoint Global Insights

CAR-T Therapy

EDGE | AUGUST 2020

WELCOME TO THE EDGE.

Morgan Stanley Investment Management's Counterpoint Global shares their proprietary views on a big idea that has the potential to trigger far-reaching consequences—ideas such as blockchain, autonomous vehicles, machine learning and gene editing.

Counterpoint Global's long-term ownership mindset emphasizes perspective, insight and thinking across categories, while our investment process focuses on identifying unique companies with sustainable competitive advantages. Through The EDGE, we share our framework for thinking about change and our process for recognizing patterns that may drastically alter the investment landscape over the longer term.

This work complements our team's more traditional, fundamental research to create a framework for long-term investing that is grounded in intellectual curiosity and flexibility, perspective, self-awareness and partnership.

Stem cell based cellular therapy

Genetically engineered cellular therapy is one of the most complex cancer therapies ever invented and has forever changed the survival outcome expectations for patients with blood cancer. Chimeric antigen receptor T (or CAR-T) cell therapy programs the patient's own immune system to attack cancer. Tumor immunologists long hoped that the immune system could be a key to curing cancer and after years of toiling in the lab, CAR-T therapy finally made this dream a reality. But despite demonstrating impressive results in blood cancers, this first generation therapy has low utilization because of high costs, complexity of treatment, and severe toxicities.

The next generation of cellular therapy has the potential to revolutionize cancer treatment. Cellular therapy based on stem cells could disrupt the current marketplace by decreasing costs and increasing the addressable market, while mimicking the impressive survival statistics we currently see with first generation therapy in patients receiving late-line treatment.

The natural immune response is complicated. A healthy immune system requires the intricate coordination of

multiple components. This system is prone to breakdown, which can lead to the development of various illnesses that include cancer. CAR-T cell therapy seeks to simplify this process by genetically engineering a patient's own cells to efficiently and effectively target and eliminate cancer. Doctors do this by removing T cells, our body's foremost fighter, from a cancer patient. They then genetically engineer the cells to express a key (or a receptor) that specifically recognizes a tumor's lock (or antigen) (*Display 1*). The genetically-engineered cells are returned to the patient. Meeting their match triggers the cells to carry out cellular processes that kill the tumor cells. Because this manufacturing process is lengthy, inconsistent, and complex, patients unable to wait for this therapy's development have limited success.

While the clinical results have been staggering (doubling to tripling the response to standard therapy, *Display 2*), initial uptake of approved therapies has been underwhelming. We believe that next generation cellular therapy will need to overcome three key challenges to increase access and expand the market potential. First, cellular therapy

Stem cell based cellular therapy is disruptive because it has the potential to address the main challenges of first generation therapy while maintaining the impressive survival rate observed in cancer patients receiving late-line treatment.

has failed in solid tumors (non-blood or liquid tumors) which remain an unmet medical need and represent over 80% of cancer deaths. Second, high costs of therapy and complex manufacturing are a hindrance to use. Lastly, severe toxicities including an immune response triggered whole-body attack (known as cytokine release syndrome) and neurotoxicity have plagued early generations of therapy. The cost of treating side effects, unwanted or unexpected events or reactions to a drug, and lengthy hospital stays create a financial burden.

Multiple next-generation approaches are under development that address the issues with first generation therapy and have the potential to revolutionize

cancer treatment. A second generation approach uses CAR-T cells that are manufactured ahead of time from healthy donors rather than the bespoke manufacturing of the cells of an ill cancer patient. This approach is known as allogeneic CAR-T therapy and is disruptive because it has the potential to reduce complexity, time to treatment, and accessibility.

As promising as allogeneic CAR-T is, the fact remains that healthy donors are inherently diverse, making therapy inconsistent and irreproducible.

To overcome this hurdle, scientists pursuing a third generation CAR-T can use stem cells which allow for the development of a well-characterized,

uniform, and ready-to-use cellular therapy. The upfront drug discovery and development is complex for cellular therapy based on stem cells but advances in genomic sequencing and editing techniques have made this technology more viable in cancer treatment. We believe the use of stem cells could convert a complicated therapeutic process into a manageable product. This would lower the cost of therapy and expand the addressable market.

Here’s a sketch of how cellular therapy based on stem cells works. Scientists begin with healthy donors and create induced pluripotent stem cells (iPSC). These are cells, often taken from the skin, that have been reprogrammed back to an embryonic-like state to enable the development of a renewable source of any type of human cell. The starting material, uniform iPSC, is engineered with properties of interest using genetic editing techniques. At this stage of development, scientists can use sequencing technology to fully characterize the genetic code of the cells. This allows them to create a known and uniform product.

Stem cell based therapy differs from first generation therapy, which uses cancer patient’s cells, and second generation therapy, which uses the inconsistent and diverse cells of healthy donors. Scientists can differentiate expanded stem cell lines into immune cells of interest, including classical T cells (the T in CAR-T) or different cell types that can potentially mitigate safety issues. The cells can then be produced at commercial scale to create a consistent clinical supply that is available for easy administration at any hospital.

First generation cellular therapy has so far been unsuccessful in dealing with solid tumors. Treating solid tumors likely requires multiple genetic changes and therefore numerous steps in genetic engineering. Because stem cell based therapy can be edited and thoroughly examined, scientists can include many complex editing steps without increasing the risk of the inappropriate changes that lead to unwanted cellular effects. This is unlike first and second generation therapy development, where

only a finite number of changes can be reliably supported and the final product is diverse rather than uniform. Stem cell based therapy therefore has the potential to be effective for both blood and solid tumors.

First generation therapy takes up to three weeks to manufacture and often fails quality control measures. Approximately 15-20% of patients do not receive their treatment in a normal clinical setting. As this therapy generates a product for each patient on a one-for-one basis, it does not scale.

Stem cells are essentially unlimited, as one batch can be expanded and stored to form a renewable and reliable supply chain for therapy development.

Stem cell based therapy does scale because it can develop an effectively infinite number of doses available for administration at any hospital. This has the potential to double gross margins as compared to the current therapy.

While the initial engineering and development of the therapeutic product based on stem cells is complex, the

* Standard of care = SCHOLAR-1 study in DLBCL, CLO-212 study in ALL

subsequent manufacturing and delivery to patients is easy and convenient. By decreasing the complexity of manufacturing and increasing scalability, stem cell based therapy increases access to therapy and lowers the cost substantially.

CAR-T therapy can be a financial drain because of the high costs of side effects and lengthy hospitalization stays. This limits adoption in outpatient settings (which is potentially better for reimbursement) and earlier lines of therapy (which is a larger total addressable market). First generation CAR-T therapy also has a black box warning for fatal or life threatening side effects. The ability to develop stem cells into any cell type, including a non-T cell therapy, may mitigate the previously observed safety risks without compromising efficacy. That said, the potential risk of long-term use of stem cells is unknown.

We believe there are five key challenges that stem cell based therapy will need to overcome. First is efficacy. Stem cell based therapy needs to demonstrate survival and response results comparable to a personalized stem cell therapy. The first of these products is currently in clinical trials after more than a decade of research and development. Second is

safety. We do not know the long-term risks of using stem cell based therapy. Whether these cells could spontaneously de-differentiate (return to their pluripotent state) and develop cancer remains an unanswered question. Third is regulatory risk. How long would it take for physicians, patients, and regulators to get comfortable with this therapy? Doctors may have to monitor patients long term for unwanted side effects, which would add to the lifetime cost and burden of therapy. Fourth is the longevity of therapy. Since this therapy is made from a foreign substance (unlike one's own immune cells), the patient's immune system may reject it. It is an open question as to whether the low persistence of therapy would diminish the therapy's ability to potentially prevent a hypothetical cancer recurrence. However, it could allow for another dose of therapy, which could have therapeutic benefits. Lastly is commercialization. The ability to scale manufacturing at a reasonable cost remains a major barrier, but we believe that the industry's continuous learning may allow it to overcome this challenge.

First generation cellular therapy has had impressive results and changed the survival statistics for blood cancer patients with no other options.

OTHER DISRUPTORS

Other themes the team is currently researching include

- Blockchain
- Autonomous vehicles
- Machine learning
- Automation/robotics

We believe stem cell based therapy has the potential to become a ubiquitous and disruptive product to treat both blood and solid cancer patients. Stem cell based therapy creates an inexpensive, eternal drug source that may simplify cellular therapy manufacturing and delivery. This therapeutic opportunity solves the main issues of earlier generation therapy such as an inability to tackle solid tumors, manufacturing complexity, high costs, and safety concerns. Stem cell based therapy ensures broader market accessibility while potentially curing cancer patients. Though drug development is still in its infancy, we believe stem cell based therapy may have enormous potential.

"Investor" refers to an analyst or portfolio manager of Counterpoint Global.

Team members may change without notice from time to time. Years of Experience listed above refers to Industry Experience.

Years of Experience, Years with Firm and Years with Team are as of September 2023.

Risk Considerations

There is no assurance that a Portfolio will achieve its investment objective. Portfolios are subject to **market risk**, which is the possibility that the market values of securities owned by the Portfolio will decline and that the value of Portfolio shares may therefore be less than what you paid for them. Market values can change daily due to economic and other events (e.g. natural disasters, health crises, terrorism, conflicts and social unrest) that affect markets, countries, companies or governments. It is difficult to predict the timing, duration, and potential adverse effects (e.g. portfolio liquidity) of events. Accordingly, you can lose money investing in this Portfolio. Please be aware that this Portfolio may be subject to certain additional risks.

In general, **equities securities'** values also fluctuate in response to activities specific to a company. Investments in **foreign markets** entail special risks such as currency, political, economic, market and liquidity risks. The risks of investing in **emerging market countries** are greater than risks associated with investments in foreign developed countries. **Privately placed and restricted securities** may be subject to resale restrictions as well as a lack of publicly available information, which will increase their illiquidity and could adversely affect the ability to value and sell them (liquidity risk). **Derivative instruments** may disproportionately increase losses and have a significant impact on performance. They also may be subject to counterparty, liquidity, valuation, correlation and market risks. **Illiquid securities** may be more difficult to sell and value than public traded securities (liquidity risk).

IMPORTANT INFORMATION

There is no guarantee that any investment strategy will work under all market conditions, and each investor should evaluate their ability to invest for the long-term, especially during periods of downturn in the market.

A separately managed account may not be appropriate for all investors. Separate accounts managed according to the Strategy include a number of securities and will not necessarily track the performance of any index. Please consider the investment objectives, risks and fees of the Strategy carefully before investing. A minimum asset level is required.

For important information about the investment managers, please refer to Form ADV Part 2.

The views and opinions and/or analysis expressed are those of the author as of the original publication date and are subject to change at any time due to market or economic conditions and may not necessarily come to pass. Furthermore, the views will not be updated or otherwise revised to reflect information that subsequently becomes available or circumstances existing, or changes occurring, after the date of publication. The views expressed do not reflect the opinions of all investment personnel at Morgan Stanley Investment Management (MSIM) and its subsidiaries and affiliates (collectively "the Firm"), and may not be reflected in all the strategies and products that the Firm offers.

Forecasts and/or estimates provided herein are subject to change and may not actually come to pass.

ASIA PACIFIC

Hong Kong: This material is disseminated by Morgan Stanley Asia Limited for use in Hong Kong and shall only be made available to "professional investors" as defined under the Securities and Futures Ordinance of Hong Kong (Cap 571). The contents of this material have not been reviewed nor approved by any regulatory authority including the Securities and Futures Commission in Hong Kong. Accordingly, save where an exemption is available under the relevant law, this material shall not be issued, circulated, distributed, directed at, or made available to, the public in Hong Kong. **Singapore:** This material is disseminated by Morgan Stanley Investment Management Company and should not be considered to be the subject of an invitation for subscription or purchase, whether directly or indirectly, to the public or any member of the public in Singapore other than (i) to an institutional investor under section 304 of the Securities and Futures Act, Chapter 289 of Singapore ("SFA"); (ii) to a "relevant

person" (which includes an accredited investor) pursuant to section 305 of the SFA, and such distribution is in accordance with the conditions specified in section 305 of the SFA; or (iii) otherwise pursuant to, and in accordance with the conditions of, any other applicable provision of the SFA. This publication has not been reviewed by the Monetary Authority of Singapore. **Australia:** This material is provided by Morgan Stanley Investment Management (Australia) Pty Ltd ABN 22122040037, AFSL No. 314182 and its affiliates and does not constitute an offer of interests. Morgan Stanley Investment Management (Australia) Pty Limited arranges for MSIM affiliates to provide financial services to Australian wholesale clients. Interests will only be offered in circumstances under which no disclosure is required under the Corporations Act 2001 (Cth) (the "Corporations Act"). Any offer of interests will not purport to be an offer of interests in circumstances under which disclosure is required under the Corporations Act and will only be made to persons who qualify as a "wholesale client" (as defined in the Corporations Act). This material will not be lodged with the Australian Securities and Investments Commission.

Japan

For professional investors, this material is circulated or distributed for informational purposes only. For those who are not professional investors, this material is provided in relation to Morgan Stanley Investment Management (Japan) Co., Ltd. ("MSIMJ")'s business with respect to discretionary investment management agreements ("IMA") and investment advisory agreements ("IAA"). This is not for the purpose of a recommendation or solicitation of transactions or offers any particular financial instruments. Under an IMA, with respect to management of assets of a client, the client prescribes basic management policies in advance and commissions MSIMJ to make all investment decisions based on an analysis of the value, etc. of the securities, and MSIMJ accepts such commission. The client shall delegate to MSIMJ the authorities necessary for making investment. MSIMJ exercises the delegated authorities based on investment decisions of MSIMJ, and the client shall not make individual instructions. All investment profits and losses belong to the clients; principal is not guaranteed. Please consider the investment objectives and nature of risks before investing. As an investment advisory fee for an IAA or an IMA, the amount of assets subject to the contract multiplied by a certain rate (the upper limit is 2.20% per annum (including tax)) shall be incurred in proportion to the contract period. For some strategies, a contingency fee may be incurred in addition to the fee mentioned above. Indirect charges also may be incurred, such as brokerage commissions for incorporated securities. Since these charges and expenses are different depending on a contract and other factors, MSIMJ cannot present the rates, upper limits, etc. in advance. All clients should read the Documents Provided Prior to the Conclusion of a Contract carefully before executing an agreement. This material is disseminated in Japan by MSIMJ, Registered No. 410 (Director of Kanto Local Finance Bureau (Financial Instruments Firms)), Membership: the Japan Securities Dealers Association, The Investment Trusts Association, Japan, the Japan Investment Advisers Association and the Type II Financial Instruments Firms Association.
